RESULT 1 ADW12903

ADW12903;

New isolated SMAPK3 polypeptides and nucleic acids, useful for diagnosing diseases, e.g. cancers, associated with the deficiency of the SMAPK3 gene in a mammal. The invention relates to novel isolated polypeptide (I) comprising an amino acid sequence selected from sequences comprising 335 or 359 amino acids (ADM12901 or ADM12903) or its fragments. The polypeptides and polynucleotides are useful for diagnosing diseases, e.g. cancers, associated with the deficiency of the SMARK3 gene in a mammal. The fragments of the polypeptides and polynucleotides can also be used as primers or probes. This sequence corresponds to the SMARX3VI variant DNA purification; diagnosis; cancer; mitogen-activated protein kinase; Claim 1; SEQ ID NO 4; 55pp; English. Human SMAPK3V2 variant protein. 18-JUL-2003; 2003US-00623108. 18-JUL-2003; 2003US-00623108. 07-APR-2005 (first entry) WPI; 2005-080923/09. N-PSDB; ADW12902 US2005013817-A1. (DAIK/) DAI K.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to human polypeptides, termed NOVX, and the polymucleotides encoding them. The polypeptides and polymucleotides are useful for diagnosing disease. The polympeptides are useful for potential therapeutic agents. The sequences are useful for treating metabolic disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated NOVX polypeptide useful for treating atherosclerosis, metabolic disorders, diabetes, obesity, infectious disease, anorexia, neurodegenerative disorders, Alzheimer's disease and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 1; Page 212; 666pp; English.

New antibodies to human MAP kinase - used for the detection, assay purification of various MAP kinase species.

Example 3; Page 34-35; 59pp; English.

This sequence represents the human mitogen activated protein (WAP) kinase ERKI. Fragments of this sequence (such as AAW15501) are recognition esquences for the antibodies of the invention. The antibodies of the invention. The antibodies of the invention. The antibodies of the invention are 1gG type monoclonal antibodies (WAD) generated by using the human ERKI as an immunogen and are capable of binding to BKRI at the Sites represented by these peptides. However, the MAD is incapable of binding to human or rat MAP kinase ERKI. The MAD are produced from cloned hybridomas derived from spleen cells of a mammal immunised with human erkil and homologous or heterologous lymphoid cells. The antibodies can be used for detecting or assaying MAP kinases. They can be used for diagnosing MAP kinase-related diseases, such as cancerassociated diseases (e.g. brain tumour), metabolic disorders (e.g. diabetes mellitus), circulatory disease (e.g. arteriosclerosis), allergic diseases (e.g. asthma, pollenosis, atopic dermatitis), central nervous system diseases (e.g. hlzheimer's disease, Parkinsonism, senile dementia) and bone/joint diseases (e.g. rheumatism). They can also be used to investigate the role of MAP kinases in-vivo and the mechanism of drug

The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polymuclectides are useful in quene therapy. A composition containing a polypeptide or polymuclectide of the invention may be used to treat diseases of the peripheral nervous containing a polypeptide or polymuclectide of the invention may be used to treat diseases of the peripheral nervous for a localised neuropathy and contral nervous system diseases, such as a lateral sclerosis, and Shy-Drager Syndrome. Other uses include the cutilisation of the activities such as: Immune system suppression, and thrombolytic activity, chemotactic/chemokinetic activity, haemostatic and therapy, drug screening, assays for receptor activity, arthritis and therapy, drug screening, assays for receptor activity, arthritis and inflammation. leukaemias and C.N.S disorders. Note: The sequence data for this patent did not form the printed specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ï

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to identifying an agent to be tested for ability to treat psychotic disorder in patient. The method involves contacting cells of tissues with a candidate drug, and determining levels of phosphorylation of intracellular signaling proteins DARPP-32 (dopamine-and cAMP-regulated phosphoprotein), ERK1 and ERK2 (extracellular signal-regulated protein kinases 1 and 2), and CREB (CAMP-response element binding protein). The method is useful for identifying an agent to be tested for an ability to treat a psychotic disorder such as schizophrenia in a patient in need of such treatment. The present sequence represents a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           VQDLMETDLYKLLKSQQLSNDHICYFLYQILRGLKYIHSANVLHRDLKPSNLLINTTCDL 180

The present invention relates to a method for identifying a ligand (L), which binds to an inactive conformation of target protein kinase (T). The method involves contactive conformation of (T), which contains or is modified to contain a reactive group at or near a binding site of interest, with one or more ligand candidates capable of covalently bonding to the reactive group thus forming a kinase-(L) conjugate (C). The method is useful for identifying protein kinase inhibitors that preferentially bind to inactive conformation of a target protein kinase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    DHVRKTRVAIKKISPFEHQTYCQRTLREIQILLRFRHENVIGIRDILRASTLEAMRDVYI
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Identifying ligand binding to inactive conformation of target protein kinase (T) comprises contacting the conformation modified (T) which contains reactive group at binding site, with ligands and detecting kinase-ligand conjugate formation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is a protein kinase which may be modified via an amino acid substitution, for use in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        MAAAAAQGGGGGBPRRTEGVGPGVPGBVEMVKGQPFDVGPRYTQLQYIGEGAYGMVSSAY

The method is useful for identifying and/or obtaining compounds that may be used in the prevention or treatment of cardiac diseases, particularly congestive heart failure. The compound or protein is also used for the preparation of a pharmaceutical composition for prevention or treatment of a disease related to hypertrophy or impaired or increased activation of telethonin (T-Cap), &agr;-actinin, MHC, actin, tith, myomesin, nebulette, tropomyosin, troponin, Erkl/2 and/or MLCK. The protein or antibody which specifically recognizes the activated/phosphorylated form of the above polypeptide, is used for the corpusation of a composition for diagnosing a disease or a predisposition for a disease related to hypertrophy or related to impaired or increased activation pells MEXI/2 and/or Erkl/2. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Identifying and/or obtaining a compound useful for preventing or treating cardiac diseases, particularly congestive heart failure, comprises quantification of the activity of Raf-1, MEK1/2 and/or Erk1/2 depending

polypeptide inhibitor, or identifying a mammalian glioma tumour that do not expresse a PTEN polypeptide and which is likely to respond or not likely to respond to an inhibitor of mTOR polypeptide activity, respectively. The biochemical pathways are, in particular, disregulated in pathologies sa cancer. The present sequence is that of the human ERK protein which may be used in the method of the invention.

This invention relates to a novel method for determining or predicting the response of a patient to HER-2 directed therapy. Specifically, it refers to analysing a mammalian tumour in order to detect a pattern of expression and/ or phosphorylation of a protein taken from the group including insulin growth factor receptor (IGFR) polypeptide, epidermal growth factor receptor (IGFR) polypeptide, epidermal phosphorylated AKT, phosphorylated NDF or phosphorylated ERK protein. The present invention describes characterising a mammalian tumour's responsiveness to an HER-2 therapy and hence an individual's response to this cancer therapy, using an immunologically specific antibody directed against one of the aforementioned proteins. Furthermore, it provides predictive biomarkers that can be used to assess the efficacy of the human phosphorylated ERK protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ä

The invention relates to a novel method for identifying a mammalian tumor responding to HER2-directed therapy, where the tumor overexpresses HER2. The method involves assaying a sample obtained from the mammalian tumor to detect a pattern of expression and/or phosphorylation of one or several polypeptides chosen from inaulin-like growth factor receptor (IGFN) polypeptide, neu (IGFN) polypeptide, neu cipentiation factor (NDF) polypeptide, phosphorylated S6 ribosomal polypeptide, phosphorylated AKT polypeptide, where the polypeptide, phosphorylated AKT polypeptide and phosphorylated control regular regulared kinase (ERK) polypeptide, where the cetected pattern of expression, phosphorylation or both expression and phosphorylation identifies mammalian tumors that respond to HER2-directed therapy. The method of the invention is useful for identifying a mammalian tumor that responds to a HER2-directed therapy, or does not respond to HER2-directed therapy.

The invention is useful for identifying a mammalian tumor that responds to a HER2-directed therapy, or does not respond to HER2-directed therapy.

The argeting HER2 or subject with cancer for treatment with a molecule targeting HER2. The method is useful for determining or predicting response to HER2-directed therapy in an individual. The method enables predicting response to HER2-directed therapy in an individual. The method canables prediction of response in cancer subjects to cancer therapy. The method of present sequence represents the numan ERK protein used in the method of present sequence represents the numan ERK protein used in the method of prediction of response in cancer subjects in the method of prediction of response in cancer subjects in the method of prediction of response in cancer subjects in the method of prediction of response in cancer subjects in the method of prediction of response in cancer subjects in the method of the prediction of response in cancer subjects in the method of the prediction of the prediction of the prediction of the predict
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Identifying mammalian tumor responding to HER2-directed therapy, involves assaying sample from tumor to detect expression and/or phosphorylation of insulin-like growth factor receptor polypeptide/erb81 receptor
                                                tumor, antibody therapy; human epidermal growth factor receptor 2; HER2; phosphorylation; extracellular signal regulated kinase; ERK.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          98.9%; Score 1859; DB 9; Length 379; 94.7%; Pred. No. 1.1e-184; ive 0; Mismatches 0; Indels 2
Human extracellular signal regulated kinase SEQ ID NO:3.

                                                                                                               purification; diagnosis; cancer; mitogen-activated protein kinase;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to novel isolated polypeptide (I) comprising an amino acid sequence selected from sequences comprising 335 or 359 amin acids (ADW12901 or ADW12903) or its fragments. The polypeptides and polynucleotides are useful for diagnosing diseases, e.g. cancers, associated with the deficiency of the SMAPK3 gene in a mammal. The fragments of the polypeptides and polynucleotides can also be used as primers or probes. This sequence corresponds to the SMAPK3VI variant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        20;

The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polymucleotides are useful in gene therapy. A composition containing a polypeptide or polymucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous as system, such as localised neuropathies and central nervous system disease, such as lazhemer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotextic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S disorders. Note: The sequence data for this patent did not form part of the printed specification

This is the amino acid sequence of ERKI. Substitution of glutamine with an amino acid with a small side chain, such as alanine and threonine foresteate a mutant kinase which can theoretically bind to a pyridinylimidazole inhibitor of p38. (Map) 1 kinase. Map 1 kinases mediate intracellular signal transduction pathways and so have a role in many diverse human diseases. For example, kinases have been implicated in cell nearty into apoptosis, cancer, Alzheimer's disease, angiotensin II and hematopoietic cytokine receptor signal transduction, oncoprotein signalling and mitosis, inflammation and infection, etc. Members of the Map kinase family share sequence similarity and conserved structural domains, and include the extracellular-signal regulated kinases (ERKS), Jun N-terminal kinases (JNKS) and p38 kinases. The invention relates to methods for designing inhibitors of serine/threonine kinases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            121 VQDIMETDLYKLLKSQQLSNDHICYFLYQILRGLKYIHSANVLHRDLKPSNLLINTTCDL 180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                241 NRPIFPGKHYLDQLNHILGILGSPSQEDLNCIINMKARNYLQSLPSKTKVAWAKLFPKSD 300

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      particularly MAP kinases, and tyrosine kinases through the use of ATP-binding site mutants of these kinases. The methods of this invention tradvantage of the fact that the mutant kinases are capable of binding inhibitory compounds of other kinases with greater affinity than the corresponding wild-type kinase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     181 KICDFGLARIADPEHDHTGFLTEYVATRWYRAPEIMLNSKGYTKSIDIWSVGCILAEMLS

extracellular signal-regulated kinase (BC 2.7.-.-) 1 - common carp)
NyAlternate names: CBRK1
C;Species: Cyprinus carpio (common carp)
C;Species: Cyprinus carpio (common carp)
C;Species: Cyprinus carpio (common carp)
C;Accession: JW0052
R;Hashimoto, H.; Yokoyama, Y.; Matsuo, Y.; Toyohara, H.; Kohno, M.; Sakaguchi, M.
J. Biochem. 123, 1031-1035, 1998
A;Title: Existence of two isoforms of extracellular signal-regulated kinase in fish.
A;Reference number: JW0052; MUID:98269030; PMID:9603989
A;Accession: JW0052
A;Reference number: JW0052; MUID:98269030; PMID:9603989
A;Cross-references: UNIPROT:Q7LZH4; UNIPARC:UPI0000175598
A;Cross-references: UNIPROT:Q7LZH4; UNIPARC:UPI0000175598
C;Comment: This enzyme is the key enzyme in the intracellular signal transduction pathwas C;Superfamily: kinase-related transforming protein; protein kinase homology
C;Keywords: Phosphotranaferase
F;54-344/Domain: protein kinase homology <KIN>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ñ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           230
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      110

protein kinase ERKZ (EC 2.7.1.-) - bovine
N.Alternate names: extracellular signal-regulated kinase
C.Species: Bos primigenius taurus (cattle)
R.E.I., Cox. M.E.; Her, J.; Parsons, S.J.
Submitted to the EMBL Data Library, July 1992
A.Description: Cloning and sequencing of ERKZ from a bovine adrenal medula cDNA library.
A.Description: S25011
A.Status: preliminary
A.Scession: S2501
A.Status: preliminary
A.Status: preliminary
A.Status: preliminary
A.Status: preliminary
A.Status: Date and Sequencing of ERKZ from a bovine adrenal medula cDNA library.

removed.

PTM: Autophosphorylated on threonine and tyrosine residues. SIMILARITY: Belongs to the Ser/Thr protein kinase family. MAP kinase subfamily.

ENZYME REGULATION: Activated by tyrosine and threonine

phosphorylation.

Biol. Cell 3:63-71(1992).
-i- FUNCTION: Kinase involved in a signal transduction pathway that activated by changes in the osmolarity of the extracellular environment. Plays an essential role in maintaining water homeostasis (By similarity).
-i- SIMILARITY: Belongs to the Ser/Thr protein kinase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  -:- SIMILARITY: Belongs to the Ser/Thr protein kinase family.

Kasahara T., Higashi C., Okano T., Fukada Y.;
Submitted (APR-2001) to the EMBL/GenBank/DDBJ databases.
-!- CATALYTIC ACTIVITY: ATP + a protein = ADP + a phosphoprotein.
-!- SIMILARITY: Belongs to the Ser/Thr protein kinase family.
-!- SIMILARITY: ARS6503.1; -; mRNA.

                                                                                                                                                                                                                                                                                                                                                                            FUNCTION: Involved in both the initiation and regulation of meiosis, mitosis, and postmitotic functions in differentiated cells by phosphorylating a number of transcription factors such as ELK-1. Phosphorylates EIF4EBP1; required for initiation of translation. Phosphorylates microtubule-associated protein 2 (MAP2) (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CATALYTIC ACTIVITY: ATP + a protein = ADP + a phosphoprotein.

COPACTOR: Magnesium (By similarity).

COPACTOR: Magnesium (By similarity).

ENZYME REGULATION: Activated by phosphorylation on tyrosine and threonine in response to insulin and NGF. Both phosphorylations are required for activity (By similarity).

TISGUE SPECIFICITY: Widely expressed.

TISGUE SPECIFICITY: Widely expressed.
